Homework 14: Covariance

1. Suppose that X and Y have joint pdf

$$f_{X,Y}(x,y) = \begin{cases} \frac{4}{5}(xy+1), & 0 < x < 1, 0 < y < 1\\ 0, & \text{otherwise} \end{cases}$$

Find Cov(X, Y), the covariance of X and Y.

- 2. Let X be uniformly distributed on [-1,1], and let $Y = X^2$. Show that Cov(X,Y) = 0 even though X and Y are far from being independent: given the value of X, $Y = X^2$ is completely determined. Prove that X and Y are not independent.
- 3. Consider random variables X_1, \ldots, X_n with

$$E(X_i) = 3$$
 for all i
 $E(X_iX_j) = 12$ for $i \neq j$
 $E(X_i^2) = 11$ for all i

Find $Var(X_1 + \cdots + X_n)$.

- 4. Let X and Y be independent, each with mean 2 and variance 1. Let U = 3X + 2Y, V = 2X 3Y. Find Var U and Cov(U, V).
- 5. Suppose that when they arrive at a party, n people throw their hats into a closet. Upon leaving, each person takes a random hat from the closet. Let X be the number of people who leave the party with their own hats. Find E(X) and Var(X).

Hint: Use indicators. Let I_j be the indicator of the event "person j leaves with her own hat".

6. A population of n people vote in an election. d vote democratic and n-d vote republican. In the next election, the probability of a democratic voter switching to republican is p_1 , and the probability of a republican voter switching to democratic is p_2 . Let X be the number of democratic votes in the second election. Find E(X) and Var(X).

Hint: Use indicators.
